# SonarCloud Enterprise

Simple, Scalable, Fast | Integrated in DevOps pipelines in minutes

## Key Benefits

easy onboarding and setup

- + Onboard projects and start analyzing your code in minutes with automatic analysis
- + Immediate access to Sonar value - start fixing code fast

scalable, flexible, fast and accurate analysis

- + Automatically scale based on demand with an elastic architecture
- + Handle increased workloads on demand, without performance bottlenecks

enterprise-ready features

- + SSO authentication, management reporting, org-wide project config, portfolios, enterprise billing

high availability, always up-to-date

- + Hosted at AWS, replicated across multiple availability zones
- + Data remains accessible in case of hardware failures or natural disasters

secure

- + Enterprise grade security using AES-256 encryption for all your data
- + Public security profile hosted at Whistic
- + ISO/IEC 27001 compliance
- + SOC 2 Type I Report (by Q3)
- + Responsible vulnerability disclosure process

cost effective

- + No Capex, no admin overhead, no downtime for upgrade

commercial support included

enterprise SLA, billing and reporting

AWS Marketplace transaction option

## Enterprise Features

### 1. Enterprise Hierarchy

- The ability to group my organizations into an enterprise, independently from the DevOps platform(s).
- Pain point resolved: This solves the challenge for large enterprises that have multiple organizations and need a way to manage these. It also paves the way for portfolios to be created across multiple organizations.

### 2. Enterprise Authentication

- SSO (Single Sign-On) authentication through SAML (Security Assertion Markup Language) delivers increased security and a single source of truth for user authentication at the enterprise level.

This enables users in the Enterprise to connect through their company's centralized identity provider. Supporting Microsoft Entra ID, Okta, JumpCloud and other IdPs.

Authentication with the DevOps platform also available.

Organization membership and group synchronization ensures that groups configured in the customer IDP are sent as attributes of the user's identity upon login.

- Pain point resolved: Organization and Group membership are synchronized, significantly reducing the administrative burden.

### 3. Reports

- Project reports: You can download and subscribe to Project reports (PDF).
- Pain point resolved: Managers want to understand the state of their projects via a standard report format.
- Security reports: You can create reports outlining performance against a range of standards.
- Pain point resolved: Managers and Security persona need an overall view of the security of their company's software and easily identify the actions to take to improve it on different levels.

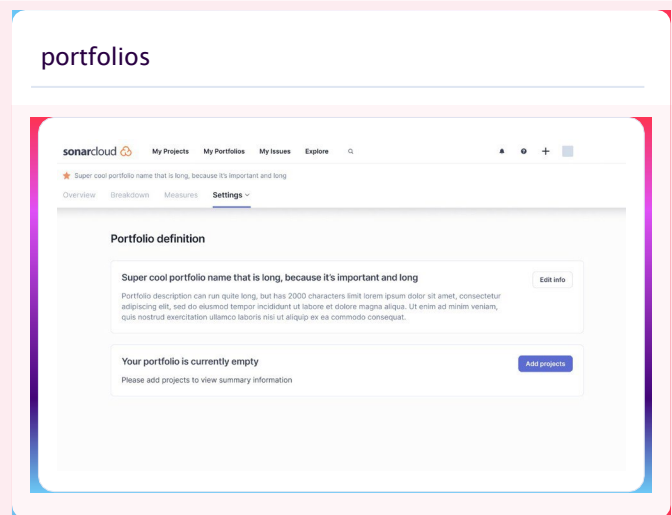

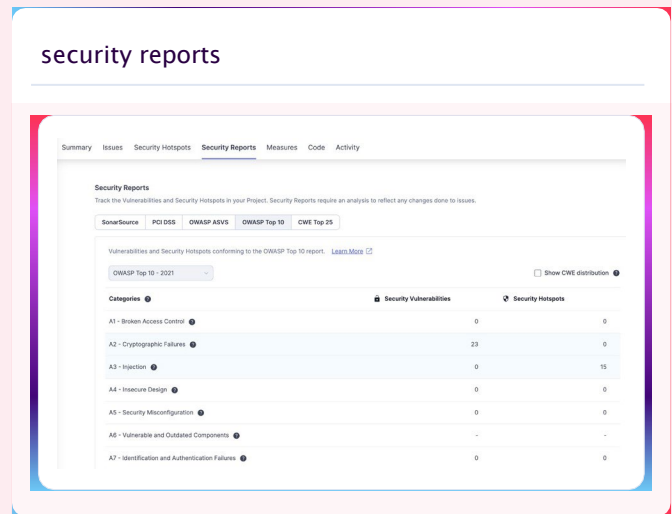

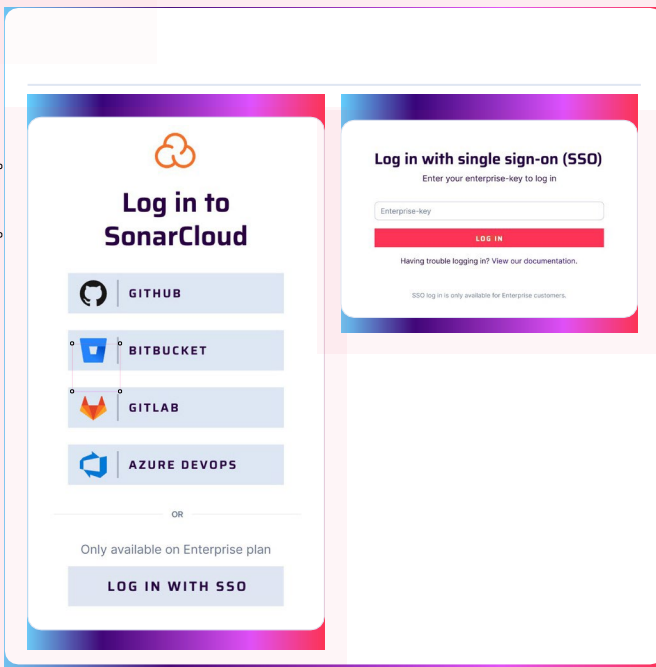

#### 4. Portfolios

- Create portfolios across the enterprise manually, by selecting individual projects. You can then see a summary view, including ratings for the portfolio and then dig into which project is leading to any low ratings.
- Pain point resolved: Managers want to have a bird's eye view of projects that may span organizations within an Enterprise. Managers want to be directed toward the projects needing the most attention.

#### 5. Organization-Wide Project Configuration

- Configured default settings can be applied to all projects at onboarding.
- Pain point resolved: Onboarding and managing many projects is tedious, especially for larger enterprises with high numbers of projects.

#### Coming Soon

- Project onboarding at scale
- Synchronized access management for DevOps platforms
- Organization tokens
- Enhanced reporting
