

Solve investigations faster

with evidence stored in one secure location

Access, search, manage, organize, and share your digital evidence files in a centralized, CJIS-compliant cloud environment.

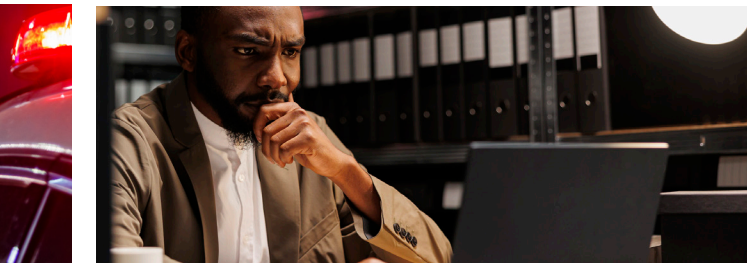

Managing digital evidence in disparate locations leads to many bottlenecks and challenges. This prevents you from operating your evidence management practice as efficiently as you need to maintain compliance, enhance the investigative review process, share evidence amongst your peers and other agencies, and reduce your backlog of FOIA requests, just to name a few.

Imagine having all your evidence in one place with access to AI workflows that make your evidence management more automated and accurate so you can find what you need in seconds. Now, you can use a modern, intelligent digital evidence management system enhanced by artificial intelligence. Connected to Veritone Investigate, Redact, Track, and IDentify, you can do more with your evidence all in one centralized hub.

Built on Veritone's award winning aiWARE platform, iDEMS is a cloud-based suite comprised of Veritone's market leading public sector solutions, including Veritone Investigate, Redact, Track, and IDentify. The integration of these tools in a single system allows agencies to access, search, manage, organize and share digital evidence files in a centralized environment, significantly improving upon legacy evidentiary software. In addition, the FBI's Criminal Justice Information System (CJIS) security compliance ensures that proper data security measures and encryption are in place such that sensitive criminal justice data is not compromised.

- + Do more than just manage your evidence—streamline redaction, improve analysis and evidence discovery, and track persons of interest across files.
- + Streamline investigations with one central location so you can collect, store and distribute all your evidence.
- + Secure and scalable cloud storage options that meet CJIS compliance standards.
- + Find new leads through an ecosystem of hundreds of AI models.
- + Close cases faster with AI-powered metadata enrichment for quick search & discovery of evidence.
- + Control access to content with internal or external stakeholders to accelerate collaboration.

Overview

Veritone iDEMS is a modernized intelligent digital evidence management system that helps public agencies and organizations expand what is humanly possible by automating workflows from disparate data silos in a secure, AI-driven centralized system, thereby helping agencies extract more valuable data and insights to solve investigations more efficiently.

Key features

App Switcher

From within your aiWARE environment, easily switch to other Veritone applications such as Investigate, Redact, IDentify, and Track.

Evidence Management

Easily manage, organize, share, and distribute audio, video, images, and PDFs on the secure AWS Cloud that's CJIS compliant.

Metadata Enrichment

Let AI instantaneously tag your unstructured forensic evidence with metadata to allow faster and more accurate keyword searches, accelerating the discovery of crucial evidence.

Connect to any data source

Connect to any cloud-based or on-premise disparate data source.

Upload any type of File

Ingest any type of audio, video, and image-based file or PDF file.

Workflow Control

Harness your evidence workflow to automate ingestion and tagging, and use permission settings to control time limits on shared assets to improve evidence oversight and security.

AI Capabilities

Access an ecosystem of hundreds of AI engines, such as Transcription, Facial Recognition, Object Detection, Text Recognition (OCR), and much more, right in your evidence management environment.

The solution

Veritone iDEMS unlocks unrealized capabilities to make your evidence management practice work for you rather than against you. At the heart of the iDEMS solution is the Veritone Investigate application. Investigate serves as the central evidence hub to store, manage, analyze, and share all digital evidence files. Upon connecting to any cloud-based or on premise data source (such as 911 systems, video management systems, etc.) and then ingesting any type of media files (such as body worn camera footage, surveillance footage, jailhouse calls, etc.), investigators can leverage primary and advanced AI models to catalog and tag unstructured data within audio, video, image and PDF evidence files, leading to actionable insights. Investigate automatically runs and processes primary AI models such as transcription, object detection, facial detection and scene classification to help agencies search, discover and catalog the fundamental information needed to accelerate investigations.

iDEMS also has seamless downstream workflows to help agencies streamline redaction (via Veritone Redact), improve analysis and evidence discovery (with Veritone Investigate), track persons of interest across files (using Veritone Tracker) and identify persons of interest from an existing records database (leveraging Veritone IDentify).

Why Veritone

- + Over 300+ customer government agencies across federal, state, and local
- + Created the world's first operating system for AI called aiWARE
- + Over 50K customer media hours processed per day within Veritone's aiWARE platform, equivalent to 5 years of audio and video content
- + Developed the first AI-powered digital evidence management system for government agencies
- + The first enterprise AI multi-cloud provider for the United States Department of Justice

About Veritone

Veritone (NASDAQ: VERI) designs human-centered AI solutions. Veritone's software and services empower individuals at many of the world's largest and most recognizable brands to run more efficiently, accelerate decision making and increase profitability.
