Kubernetes 101

An introduction to containers,
Kubernetes, and OpenShift

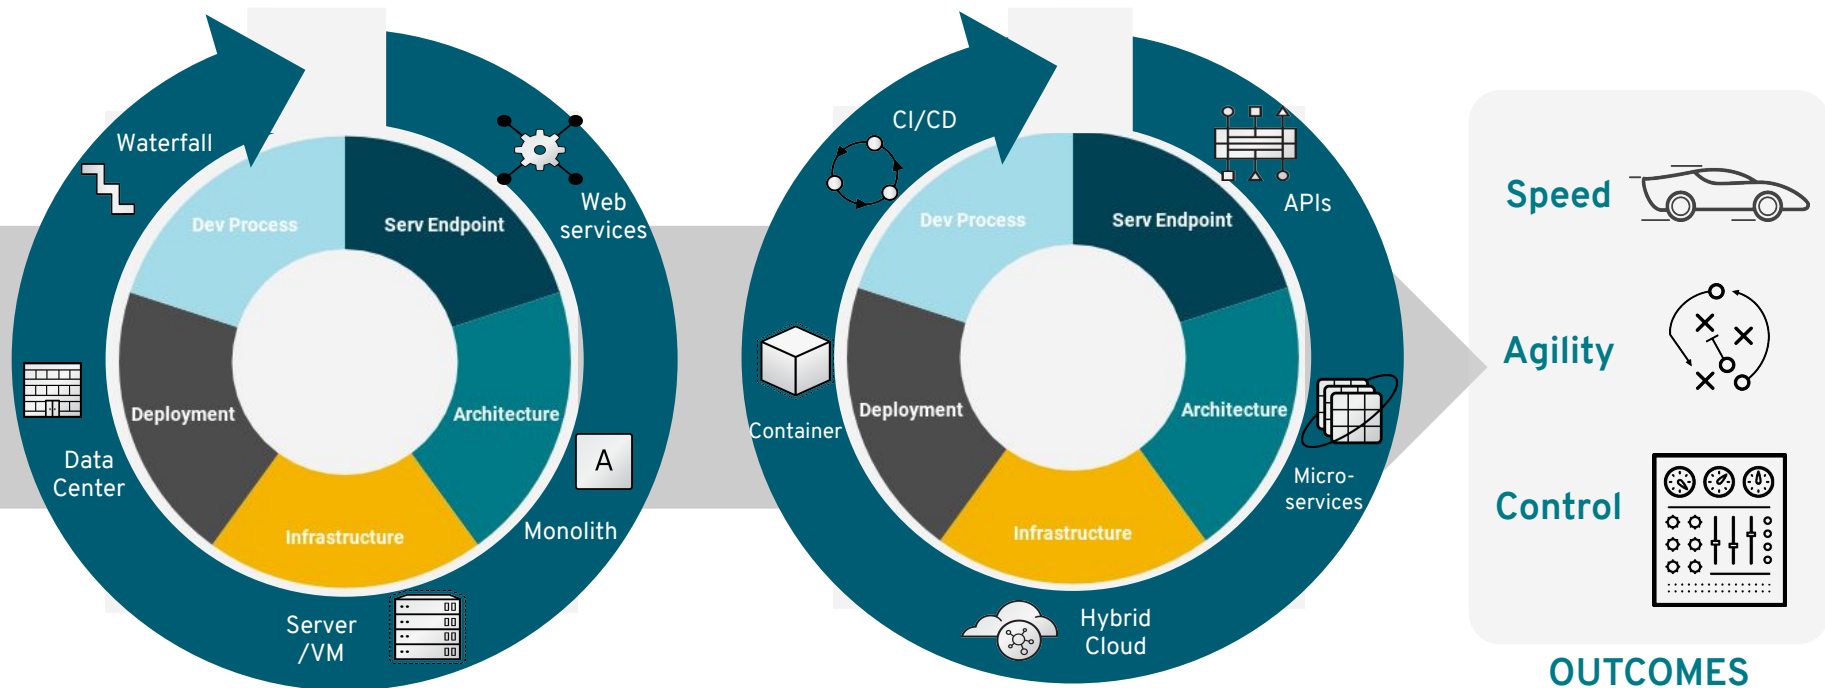

John Walter, Solutions Architect

AGENDA

- Why containers?
- What is Kubernetes?
- What is OpenShift?
- **BREAK**
- Why Kubernetes?
- What is Kubernetes? Part 2
- **BREAK**
- Guided demonstrations (**with BREAKS**)
- Red Hat OpenShift Training
- Q&A

Why containers?

NEW PATTERNS FOR DEVELOPMENT

AGILE INTEGRATION

Traditional integration incompatible with
Cloud development

Centralize ♦ Leverage ♦ Simplify
Internal teams ♦ Maximize use of resources

Modern architectures and app development
requires more agile integration

Distributed Integration ♦ Scalability ♦ Reusability
Agile Teams ♦ Distributed App Dev

USE INTEGRATION WHERE NEEDED, RATHER THAN CENTRALIZING

WHAT ARE CONTAINERS?

It Depends Who You Ask

INFRASTRUCTURE

APPLICATIONS

- Application processes on a shared kernel
- Simpler, lighter, and denser than VMs
- Portable across different environments
- Package apps with all dependencies
- Deploy to any environment in seconds
- Easily accessed and shared

VIRTUAL MACHINES AND CONTAINERS

VIRTUAL MACHINES

VM isolates the hardware

CONTAINERS

Container isolates the process

VIRTUAL MACHINES AND CONTAINERS

- + VM Isolation
- Complete OS
- Static Compute
- Static Memory
- High Resource Usage

- + Container Isolation
- + Shared Kernel
- + Burstable Compute
- + Burstable Memory
- + Low Resource Usage

VIRTUAL MACHINES AND CONTAINERS

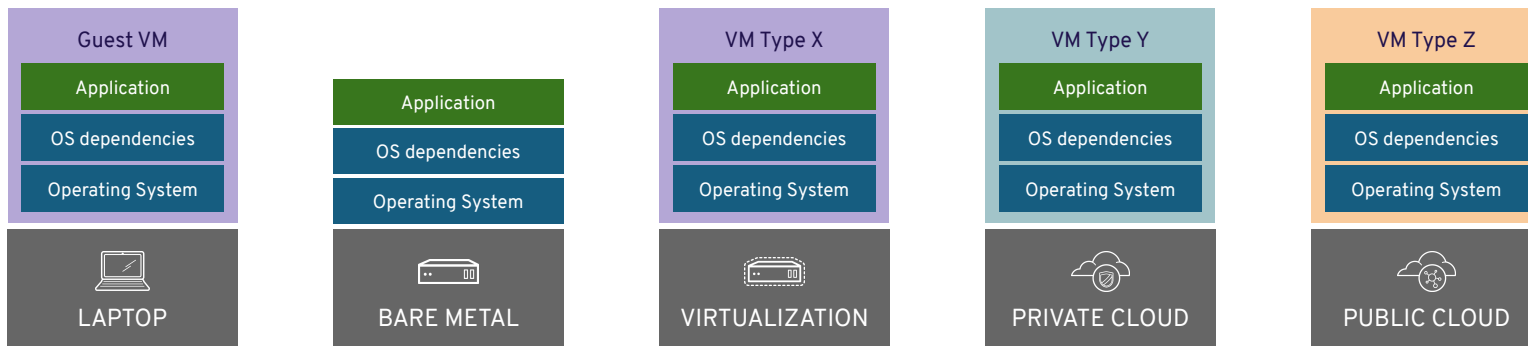

■ Optimized for stability

■ Optimized for agility

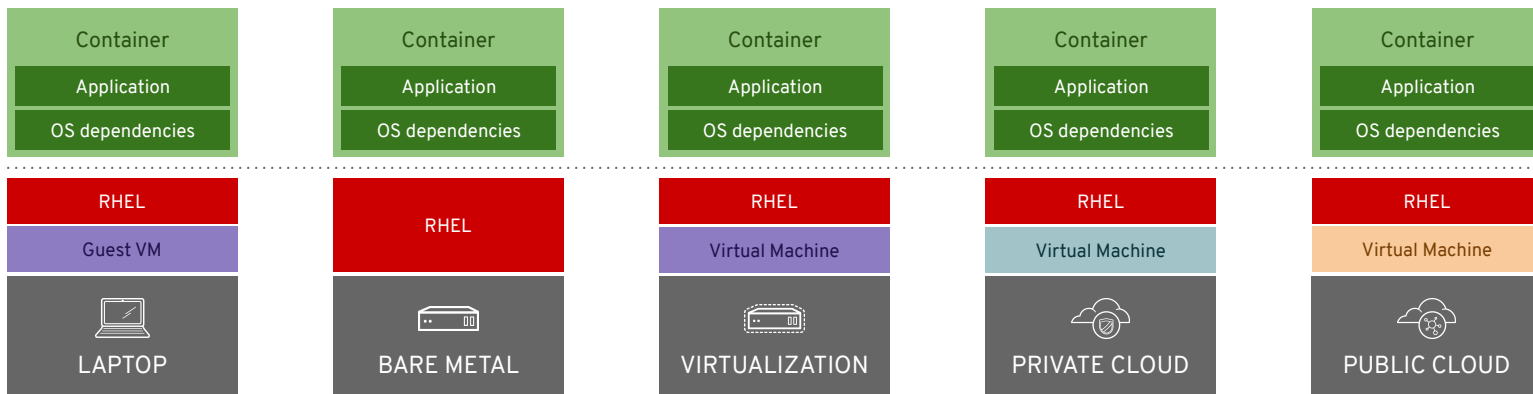

APPLICATION PORTABILITY WITH VM

Virtual machines are **NOT** portable across hypervisor and do **NOT** provide portable packaging for applications

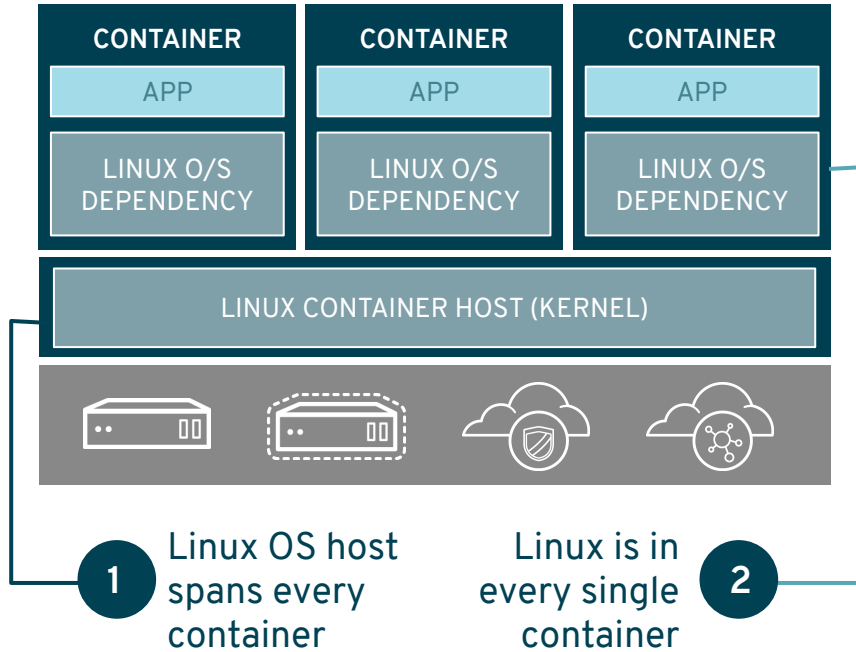

APPLICATION PORTABILITY WITH CONTAINERS

RHEL Containers + RHEL Host = Guaranteed Portability
Across Any Infrastructure

LINUX AND CONTAINER INFRASTRUCTURE

CONTAINERS ARE LINUX

Red Hat
Enterprise Linux
is a leader in paid
Linux

70%
CY2016 paid
Linux share

CONTAINERS IN A NUTSHELL

- Application portability across hybrid cloud environments
- Allow developers to focus on their application vs. underlying infrastructure
- Deployed for shorter periods of time than VMs
- Removing complexity through minimalism
- **Presents new challenges for Operations teams**

What is Kubernetes?

HOW DO I MANAGE THESE CONTAINERS?

- How do I manage configuration, service discovery, and resource scaling?
- Where do I configure my cluster?
- How do I update my applications?
- How do I update the underlying cluster?
- How can I simplify my complex applications?

KUBERNETES IN A NUTSHELL

- Application portability across hybrid cloud environments
- Allow developers to focus on their application vs. underlying infrastructure
- Deployed for shorter periods of time than VMs
- Removing complexity through minimalism
- **Presents new challenges for Operations teams**

KUBERNETES AS CONTAINER ORCHESTRATION

- Schedulers and scheduling
- Service discovery and load balancing
- Resource management

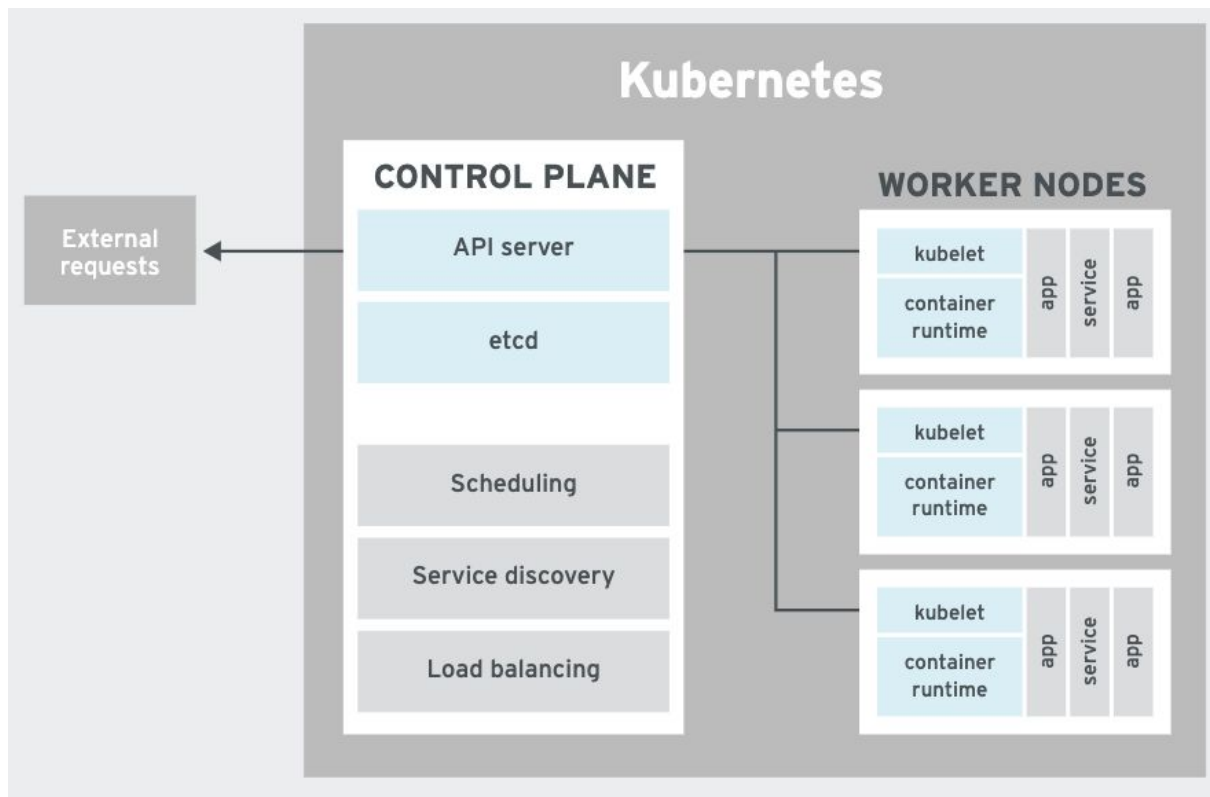

THE BENEFITS OF KUBERNETES

- Scalability
- Portability
- Consistent deployments
- Separated and automated operations and development

BASIC KUBERNETES ARCHITECTURE

Deployment Topologies Storage RBAC
Operating Systems Containers
Scaling Alerting Telemetry
Log Aggregation Metrics
WHY SO HARD?
High Availability Image Management
Security Self Healing
Patching VMs Networking Monitoring App Servers
Routing Configuration Management

	Databases	Data Warehouse	Streaming	Languages & Frameworks	SCM	Registry Services	Application Definition	CI / CD	Services as Code	API management
Application Definition & Development										

	Scheduling & Orchestration	Coordination & Service Discovery	Service Management
Orchestration & Management			

	OS	Cloud-Native Storage	Container Runtime	Cloud-Native Network
Runtime				

	Infrastructure Automation	Host Management / Tooling	Secure Images
Provisioning			

Infrastructure

Observability & Analysis
<p>Monitoring</p>
<p>Logging</p>
<p>Event-based compute</p>
<p>Tracing</p>

CNCF Projects

github.com/cncf/landscape

Kubernetes **done right** is hard

INSTALL

- Templating
- Validation
- OS setup

DEPLOY

- Identity & security access
- App monitoring & alerts
- Storage & persistence
- Egress, ingress, & integration
- Host container images
- Build/Deploy methodology

HARDEN

- Platform monitoring & alerts
- Metering & chargeback
- Platform security hardening
- Image hardening
- Security certifications
- Network policy
- Disaster recovery
- Resource segmentation

OPERATE

- OS upgrade & patch
- Platform upgrade & patch
- Image upgrade & patch
- App upgrade & patch
- Security patches
- Continuous security scanning
- Multi-environment rollout
- Enterprise container registry
- Cluster & app elasticity
- Monitor, alert, remediate
- Log aggregation

 **75%**

of enterprise users identify
complexity of implementation and
operations as the top blocker to adoption

What is OpenShift?

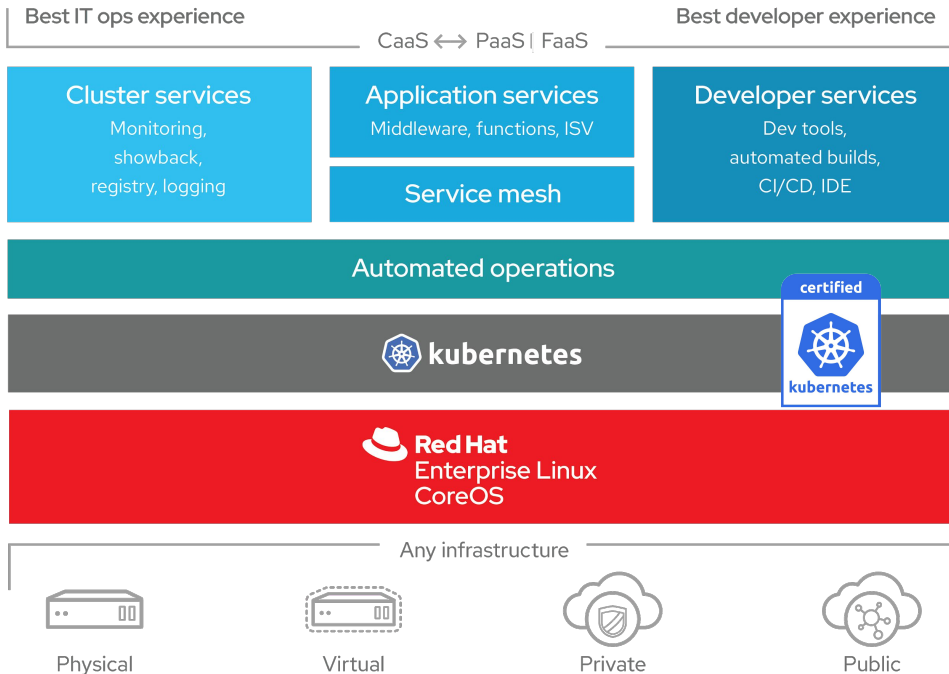

OPENSIFT IS ENTERPRISE KUBERNETES

Red Hat makes building application with containers easy

OpenShift 4 - A smarter Kubernetes platform

Automated, full-stack installation from the container host to application services

Seamless Kubernetes deployment to any cloud or on-premises environment

Autoscaling of cloud resources

One-click updates for platform, services, and applications

With OpenShift you can deliver all your applications in a whole new way

Traditional apps

Cloud-native apps

AI/ML, Functions...

Container & DevOps Platform

Edge

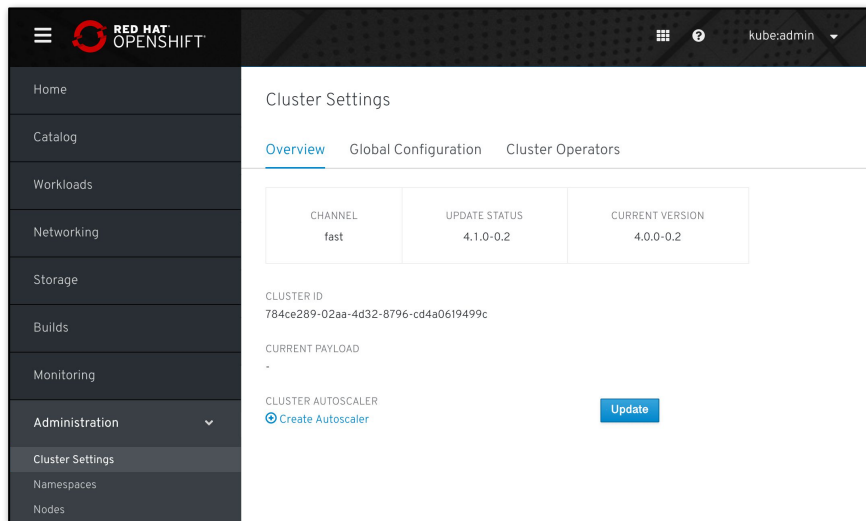

Datacenter

Hybrid & Multi-Cloud

Over the Air (OTA) Updates

- OpenShift retrieves the list of available updates
- Admin selects the target version
- OpenShift is updated over the air
- Auto-update support

Comprehensive **container security**

New School

OPENSIFT

Container Technology

Easy to scale up

Mature technology

Supporting Modern Apps workloads and Cloud Native

a container is the smallest compute unit

containers are created from container images

container images are structured in layers

Container Image Layers

Example Container Image

anatomy of a Dockerfile

```
FROM registry.access.redhat.com/ubi8/ubi
```

```
ENV foo=text
```

```
RUN dnf install -y java-11-openjdk
```

```
ADD my-app.jar /home/my-app.jar
```

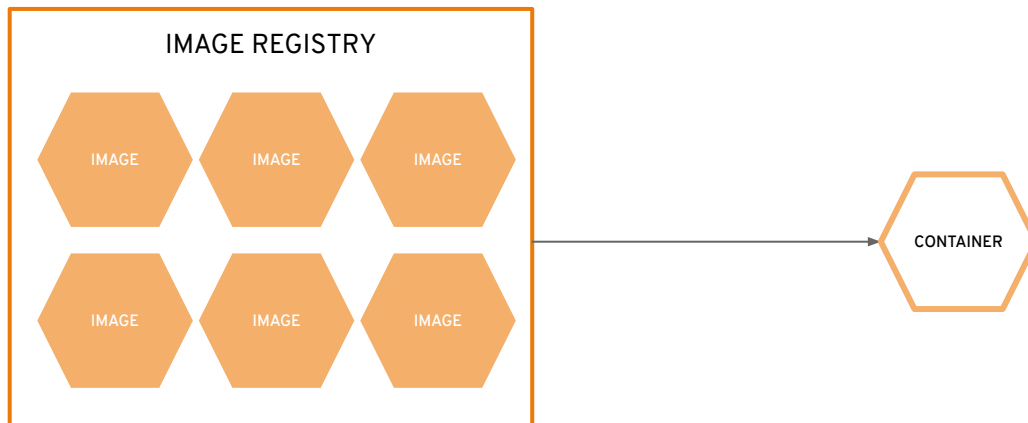

```
EXPOSE 8080
```

```
CMD java -jar /home/my-app.jar
```

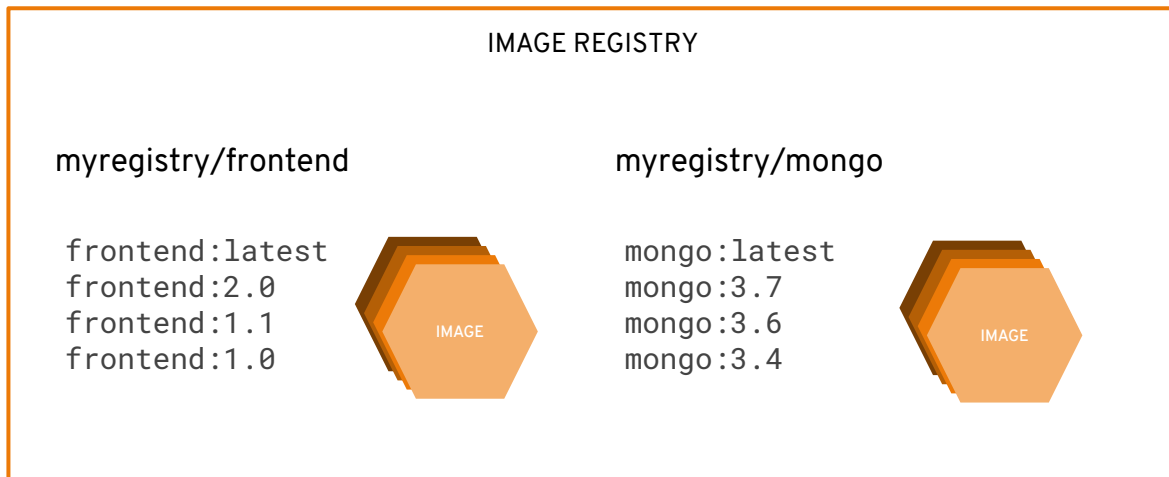

- 1 Inherit from a base image
- 2 Parameters as environment variables
- 3 Install dependencies (tooling from base image)
- 4 Add your app as a new Layer
- 5 Expose the port your app will use
- 6 Run the app

Example for Java app

container images are stored in an image registry

an image repository contains all versions of an image in the image registry

What is Kubernetes?

What is Kubernetes?

An open source orchestration system for managing containerized workloads across a cluster of nodes.

Understanding Kubernetes Objects

Kubernetes objects are persistent entities that represent the desired state of your cluster that you can manage with the K8s API

Understanding Kubernetes Objects

Pod	ReplicaSet
Deployment	Secret
Namespace	ConfigMap
Service	PersistentVolume

Kubernetes provides an API

API object primitives include these:

```
kind  
apiVersion  
metadata  
spec  
status
```

Node

- Node: a host machine where containerized workloads run
- Node activity is managed by one or more Master instances

Pod

- A group of one or more co-located containers
- Minimum unit of scale

```
kind: Pod
```

```
apiVersion: v1
```

```
metadata:
```

```
  creationTimestamp:
```

```
  name: hello-k8s
```

```
  labels:
```

```
    run: hello-k8s
```

```
spec:
```

```
  containers:
```

```
  - name: hello-k8s
```

```
    image: jkleinert/nodejsint-workshop
```

```
    ports:
```

```
    - containerPort: 8080
```

```
    resources: {}
```

Pod

```
kubectl create -f  
https://raw.githubusercontent.com/jankleinert/hello-workshop/master/pod.json
```

```
kubectl get pods
```

```
kubectl describe pod/hello-k8s
```

Service

- Acts as a single endpoint for a collection of replicated pods
- Like a load balancer

```
kind: Service
apiVersion: v1
metadata:
  name: hello-k8s
  creationTimestamp:
  labels:
    run: hello-k8s
spec:
  ports:
    - protocol: TCP
      port: 8080
      targetPort: 8080
  selector:
    run: hello-k8s
  type: NodePort
status:
  loadBalancer: {}
```

Service

```
kubectl expose pod/hello-k8s --port 8080 --type=NodePort
```

```
kubectl get svc/hello-k8s -o yaml
```

```
curl hello-k8s.<userX>:8080
```

Clean up

```
kubectl get pods -l run=hello-k8s
```

```
kubectl delete pods -l run=hello-k8s
```

```
kubectl delete service hello-k8s
```

Deployment

- Helps you specify container runtime, in terms of pods

```
kind: Deployment
apiVersion: apps/v1
metadata:
  name: hello-k8s
  creationTimestamp:
  labels:
    run: hello-k8s
spec:
  replicas: 1
  selector:
    matchLabels:
      run: hello-k8s
  template:
    metadata:
      creationTimestamp:
      labels:
        run: hello-k8s
    spec:
      containers:
        - name: hello-k8s
          image: jkleinert/nodejsint-workshop
          resources: {}
      strategy: {}
status: {}
```

Tolerations 0 Tolerations

- Scaling Apps
- Logging
- Labels
- Permissions
- Accessing and debugging Containers

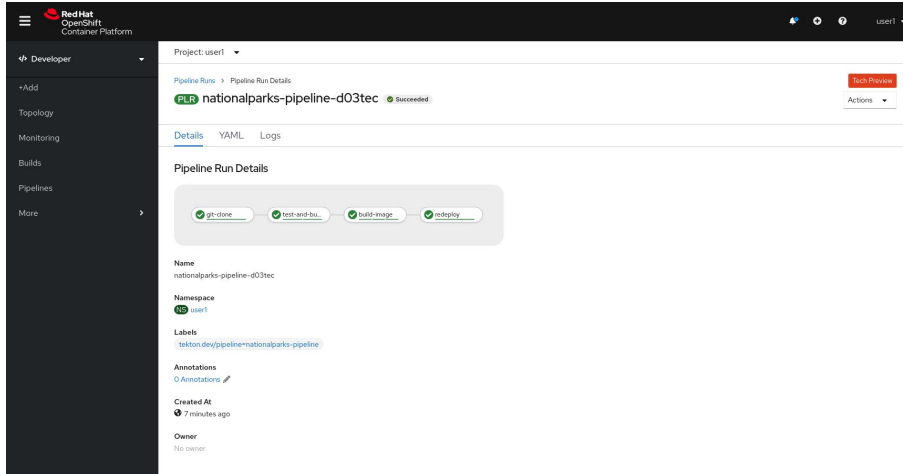

NationalParks Backend

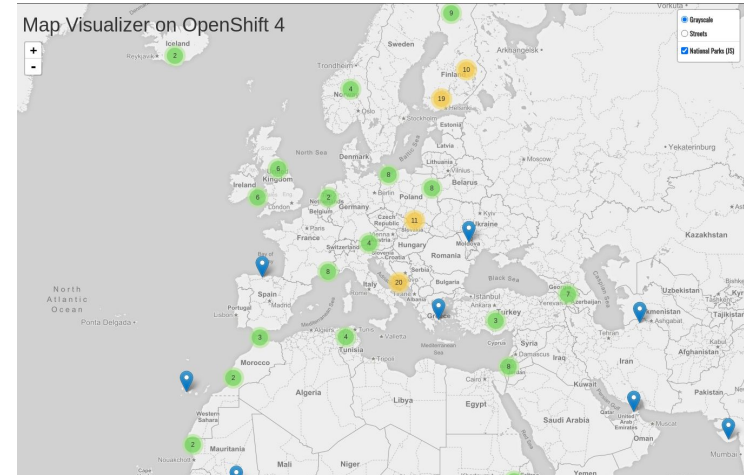

- Backend to show worldwide National Parks
- Using MongoDB Database to save and retrieve data as geo locations
- Exposes REST APIs for Parksmap frontend
- Create Container Image automatically from source code using S2I (Source-to-Image)
- Available for Java, NodeJS, Python and .NET Core

NationalParks: Exploring OpenShift

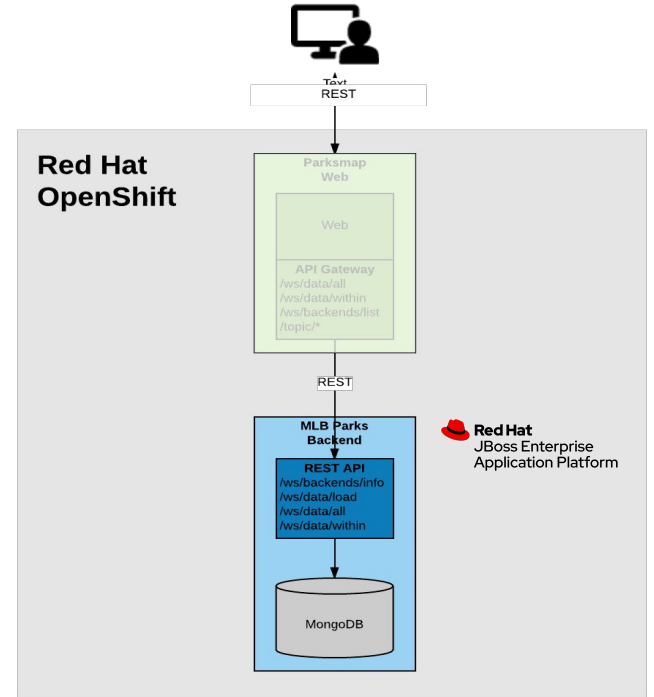

- Health Checks
- Automation with Pipelines
- Web Hooks to build and deploy automatically from code changes

MLB Parks Backend (Java)

- OpenShift runs nicely also “legacy” apps
- Java EE backend to show Major League Baseball Stadiums in North America
- Build artifacts (.war) locally with your IDE or workstation
- Create and deploy Container Image to OpenShift with S2I Binary Builds

Red Hat OpenShift Training

Start here - Introduction to OpenShift

DO180	Red Hat OpenShift I: Containers & Kubernetes
EX180	Red Hat Certified Specialist in Containers and Kubernetes

Administrator Track

DO280	Red Hat OpenShift Administration II: Operating a Production Kubernetes Cluster
EX280	Red Hat Certified Specialist in OpenShift Administration
DO322	Red Hat OpenShift Installation Lab
DO380	Red Hat OpenShift Administration III: Scaling Kubernetes Deployments in the Enterprise

DevSecOps Track

DO425	Red Hat Security: Securing Containers and OpenShift
EX425	Red Hat Certified Specialist in Security: Containers and OpenShift Container Platform

Developer Track

DO288	Red Hat OpenShift Development II: Containerizing Applications
EX288	Red Hat Certified Specialist in OpenShift Application Development
DO378	Red Hat Cloud-native Microservices Development with Quarkus
DO328	Building Resilient Microservices with Istio and Red Hat Service Mesh
AD421	Camel Integration and Development with Red Hat Fuse on OpenShift

Introduction to containers, Kubernetes, and OpenShift (DO180)

Learn to build and manage containers for deployment on a Kubernetes and Red Hat OpenShift cluster

Introduction to Containers, Kubernetes, and Red Hat OpenShift (DO180) helps you build core knowledge in managing containers through hands-on experience with containers, Kubernetes, and the Red Hat® OpenShift® Container Platform. These skills are needed for multiple roles, including developers, administrators, and site reliability engineers.

Topics covered include understanding container and OpenShift architecture, creating containerized services, and deploying applications on Kubernetes and Red Hat OpenShift.

Audience:

- Developers who wish to containerize software applications
- Administrators who are new to container technology and container orchestration
- Architects who are considering using container technologies in software architectures
- Site reliability engineers who are considering using Kubernetes and Red Hat OpenShift

Prerequisites: Be able to use a Linux terminal session, issue operating system commands, and be familiar with shell scripting. Experience with web application architectures and their corresponding technologies is recommended, but not required.

WAYS TO TRAIN

Onsite Training

Private On-site training and exams delivered at your location or at one of our training centers

Classroom Training

Training and test in a professional classroom environment led by Red Hat Certified Instructors

Virtual Training

Live instructor-led online training with the same high-quality, hands-on labs you'd find in our classrooms

Online Learning

90 days of access to course content and up to 80 hours of hands on labs – all available online, at your pace, and your schedule.

Red Hat Learning Subscription Evolution

Introducing a Premium subscription tier

Red Hat classroom exams

Classroom exams are scheduled exams that are publicly available and delivered in an IT classroom, typically to multiple examinees and monitored by an in-person proctor.

Red Hat onsite exams

Onsite exams are classroom exams delivered privately to an organization at its location or a location of its choosing.

Red Hat individual exams

Individual exams are exams for which examinees choose the date, time and place. Two different options exist, though not necessarily for all exams:

Red Hat testing center exams

Testing center exams are delivered in locations with a specially-configured exam system and for which candidates are observed by a remote proctor.

NEW: Red Hat remote exams

Remote exams are delivered online at your home, office or other location of your choice and observed by a remote proctor.
